

# 硅谷课堂第十三天-公众号点播课程和直播管理

#### 硅谷课堂第十三天-公众号点播课程和直播管理

- 一、实现公众号点播课程相关功能
  - 1、课程列表和详情
    - ■1.1、需求说明
    - ■1.2、编写课程列表和详情接口
    - ■1.3、整合课程列表和详情前端
    - 2、点播视频播放
      - ■1.1、获取视频播放参数
      - ■1.2、整合点播视频播放前端
    - 3、付费观看点播课程接口
      - ■3.1、需求介绍
      - ■3.2、编写创建订单接口
      - ■3.3、创建获取课程信息接口
      - ■3.4、创建获取优惠券接口
      - ●3.5、获取当前用户 id
      - •3.6、生成订单 Service
    - 4、微信支付
      - ■4.1、微信支付
      - •4.2、公众号配置
      - •4.3、创建订单支付接口
      - •4.4、服务号测试过程
      - ■4.5、整合点播视频支付前端
      - -4.6、订单详情接口
      - •4.7、查询支付结果

#### 二、直播介绍

- ■1、项目需求
- 2、了解直播
  - ■2.1、通用直播模型
  - 2.2、如何快速开发完整直播

- ■2.2.1、利用第三方 SDK 开发
- ■2.2.2、第三方 SDK 好处
- ■3、欢拓云直播
- 三、直播对接
- 1、直播体验
  - ■1.1、开通账号
  - ■1.2、创建直播
  - ■1.3、开始直播
  - ■1.4、用户观看
  - -1.5、体验总结

# 一、实现公众号点播课程相关功能

- 1、课程列表和详情
- 1.1、需求说明
  - (1) 点击课程中的分类,根据分类查询课程列表

java基础课程

课时数: 2 购买数: 5999 访问量: 10058

¥19800.

去看看

14417人 分享 收藏 SpringMVC

课时数: 23 购买数: 892 访问量: 9108 ¥22800

去看看

#### (2) 点击去看看,进入课程详情页面

# java基础课程

价格: ¥19800.00

立即购买

主讲: 张老师

#### 课程详情

#### 课程大纲

第一章节

^

第一课时

观看

- 1.2、编写课程列表和详情接口
- (1)创建 CourseApiController

```
@Api(tags = "课程")
@RestController
@RequestMapping("/api/vod/course")
public class CourseApiController {
   @Autowired
   private CourseService;
   private ChapterService chapterService;
   @ApiOperation("根据课程分类查询课程列表")
   @GetMapping("{subjectParentId}/{page}/{limit}")
   public Result findPageCourse(@ApiParam(value = "课程一级分类ID", required = true) @PathVariable
                               @ApiParam(name = "page", value = "当前页码", required = true) @Pa
                               @ApiParam(name = "limit", value = "每页记录数", required = true)
       CourseQueryVo = new CourseQueryVo();
       courseQueryVo.setSubjectParentId(subjectParentId);
       Page<Course> pageParam = new Page<>(page,limit);
       Map<String.Object> map = courseService.findPage(pageParam,courseQueryVo);
       return Result.ok(map);
   @ApiOperation("根据ID查询课程")
   @GetMapping("getInfo/{courseId}")
   public Result getInfo()
           @ApiParam(value = "课程ID", required = true)
           @PathVariable Long courseId){
       Map<String, Object> map = courseService.getInfoById(courseId);
       return Result.ok(map);
```

```
//课程列表
Map<String,Object> findPage(Page<Course> pageParam, CourseQueryVo courseQueryVo);

//根据id查询课程
Map<String, Object> getInfoById(Long courseId);
```

(3) 编写 CourseServiceImpl

```
public Map<String.Object> findPage(Page<Course> pageParam, CourseQueryVo courseQueryVo) {
   String title = courseQueryVo.getTitle();//名称
   Long subjectId = courseQueryVo.getSubjectId();//二级分类
   Long subjectParentId = courseQueryVo.getSubjectParentId();//一级分类
   Long teacherId = courseQueryVo.getTeacherId();//讲师
   QueryWrapper<Course> wrapper = new QueryWrapper<>();
   if(!StringUtils.isEmpty(title)) {
       wrapper.like("title",title);
   if(!StringUtils.isEmpty(subjectId)) {
       wrapper.eq("subject_id",subjectId);
   if(!StringUtils.isEmpty(subjectParentId)) {
       wrapper.eq("subject_parent_id",subjectParentId);
   if(!StringUtils.isEmpty(teacherId)) {
       wrapper.eq("teacher_id",teacherId);
   Page < Course > pages = baseMapper.selectPage(pageParam, wrapper);
   long totalCount = pages.getTotal();//总记录数
   long totalPage = pages.getPages();//总页数
   long currentPage = pages.getCurrent();//当前页
   long size = pages.getSize();//每页记录数
   List<Course> records = pages.getRecords();
   records.stream().forEach(item -> {
       this.getTeacherOrSubjectName(item);
   Map<String,Object> map = new HashMap<>();
   map.put("totalCount", totalCount);
```

```
map.put("totalPage",totalPage);
    map.put("records", records);
    return map;
private Course getTeacherOrSubjectName(Course course) {
    Teacher teacher = teacherService.getById(course.getTeacherId());
   if(teacher != null) {
       course.getParam().put("teacherName",teacher.getName());
    Subject subjectOne = subjectService.getById(course.getSubjectParentId());
   if(subjectOne != null) {
        course.getParam().put("subjectParentTitle",subjectOne.getTitle());
    Subject subjectTwo = subjectService.getById(course.getSubjectId());
    if(subjectTwo != null) {
       course.getParam().put("subjectTitle",subjectTwo.getTitle());
    return course;
public Map<String, Object> getInfoById(Long id) {
    Course course = baseMapper.selectById(id);
    course.setViewCount(course.getViewCount() + 1);
    baseMapper.updateById(course);
    Map<String, Object> map = new HashMap<>();
    CourseVo courseVo = baseMapper.selectCourseVoById(id);
    List<ChapterVo> chapterVoList = chapterService.getNestedTreeList(id);
    CourseDescription courseDescription = descriptionService.getById(id);
    Teacher teacher = teacherService.getById(course.getTeacherId());
```

# (4) 编写 CourseMapper

```
public interface CourseMapper extends BaseMapper<Course> {
    CoursePublishVo selectCoursePublishVoById(Long id);
    CourseVo selectCourseVoById(Long id);
}
```

# (5) 编写 CourseMapper.xml

```
<!DOCTYPE mapper PUBLIC "-//mybatis.org//DTD Mapper 3.0//EN" "http://mybatis.org/dtd/mybatis-3-map</pre>
<mapper namespace="com.atguigu.ggkt.vod.mapper.CourseMapper">
    <select id="selectCoursePublishVoById" resultType="com.atguigu.ggkt.vo.vod.CoursePublishVo">
       c.id,
       c.title,
       c.cover,
       c.lesson_num AS lessonNum,
       t.name AS teacherName,
       s1.title AS subjectParentTitle,
       s2.title AS subjectTitle
       FROM
       WHERE c.id = #{id}
    </select>
    <select id="selectCourseVoById" resultType="com.atguigu.ggkt.vo.vod.CourseVo">
        SELECT
        <include refid="tables" />
       WHERE c.id = #{id}
    </select>
       c.id,
       c.title,
       c.lesson_num AS lessonNum,
       c.price,
       c.cover,
       c.buy_count AS buyCount,
       c.view count AS viewCount,
       c.status,
        c.publish_time AS publishTime,
```

```
c.teacher_id as teacherId,
    t.name AS teacherName,
    s1.title AS subjectParentTitle,
    s2.title AS subjectTitle
    </sql>
    <sql id="tables">
        course c
        LEFT JOIN teacher t ON c.teacher_id = t.id
        LEFT JOIN subject s1 ON c.subject_parent_id = s1.id
        LEFT JOIN subject s2 ON c.subject_id = s2.id
        </sql>
    </mapper>
```

# 1.3、整合课程列表和详情前端

#### (1) 查看路由文件

```
src
api
assets
components
router
Js index.js
```

```
path: '/course/:subjectId',
name: 'Course',
component: () =>
    import('../views/course.vue'),
}

{

path: '/courseInfo/:courseId',
name: 'CourseInfo',
component: () =>
    import('../views/courseInfo.vue'),
},
```

# (2) 创建 js 文件定义接口

```
✓ src

✓ api

Js coupon.js

Js course.js
```

```
import request from "@/utils/request";
const api_name = "/api/vod/course";
export default {
    // 课程分页列表
    findPage(subjectParentId, pageNo, pageSize) {
        return request({
          url: `${api_name}/${subjectParentId}/${pageNo}/${pageSize}`,
          method: "get",
        });
    },
    // 课程详情
    getInfo(courseId) {
        return request({
          url: `${api_name}/getInfo/${courseId}`,
          method: "get",
        });
    },
    // image in the page in t
```

#### (3) 编写页面

#### course.vue

```
width="100%"
 height="200"
 src="https://cdn.uviewui.com/uview/swiper/1.jpg"
<van-pull-refresh v-model="refreshing" @refresh="onRefresh">
 <!-- offset: 滚动条与底部距离小于 offset 时触发load事件 默认300, 因此要改小,否则首次进入一直触发
   :finished="finished"
   finished-text="没有更多了"
   offset="10"
   <van-card
     :key="index"
     :title="item.title"
     :thumb="item.cover"
     <template #tags>
       <van-tag round plain color="#ffe1e1" text-color="#ad0000"</pre>
         >课时数: {{ item.lessonNum }}</van-tag
       <van-tag round plain color="#ffe1e1" text-color="#ad0000"</pre>
         >购买数: {{ item.buyCount }}</van-tag
       <van-tag round plain color="#ffe1e1" text-color="#ad0000"</pre>
         >访问量: {{ item.viewCount }}</van-tag
     <template #footer>
```

```
<van-button size="mini" @click="info(item.id)">去看看</van-button>
      </van-card>
  </van-pull-refresh>
</div>
import courseApi from "@/api/course";
export default {
 name: "Course",
  data() {
   return {
     subjectParentId: 1,
     loading: false,
     finished: false,
     refreshing: false,
     pageNo: 1,
     pageSize: 5,
     pages: 1,
     list: [],
  created() {
   this.subjectParentId = this.$route.params.subjectId;
 methods: {
   onLoad() {
     this.fetchData();
   onRefresh() {
     this.finished = false;
     this.pageNo = 1;
      this.loading = true;
```

```
this.fetchData();
      fetchData() {
          .findPage(this.subjectParentId, this.pageNo, this.pageSize)
          .then((response) => {
            console.log(response.data);
            if (this.refreshing) {
              this.list = [];
              this.refreshing = false;
            for (let i = 0; i < response.data.records.length; i++) {</pre>
              this.list.push(response.data.records[i]);
            this.pages = response.data.pages;
            this.loading = false;
            if (this.pageNo >= this.pages) {
              this.finished = true;
            this.pageNo++;
      info(id) {
       this.$router.push({ path: "/courseInfo/" + id });
<style lang="scss" scoped>
     margin: 10px;
     padding-bottom: 5px;
     border-bottom: 1px solid #e5e5e5;
     h1 {
       font-size: 20px;
```

```
.list-box {
    display: flex;
    font-size: 14px;
    ul {
        flex: 1;
        margin: 0;
        li {
            margin: 0;
            border-bottom: none;
        }
    }
    p {
        margin: 0;
        width: 50px;
        align-items: center;
        align-self: flex-end;
    }
    }
}
</style>
```

courseInfo.vue

```
<van-image width="100%" height="200" :src="courseVo.cover" />
<van-row>
 <van-col span="8">
   <div class="course count">

     font-size: 14px;
   }
   p {
     margin: 0;
   }
}
</style>
```

# 2、点播视频播放

# 课程大纲

#### 1.1、获取视频播放参数

(1) 创建 VodApiController

(2) application.properties 添加

```
tencent.video.appid=1312624373
```

(3) VodService 创建方法

```
//获取视频播放凭证
Map<String,Object> getPlayAuth(Long courseId, Long videoId);
```

(4) VodServiceImpl 实现方法

```
@Value("${tencent.video.appid}")
private String appId;

//点播视频播放接口
@Override
public Map<String, Object> getPlayAuth(Long courseId, Long videoId) {
    //根据小节id获取小节对象, 获取腾讯云视频id
    Video video = videoService.getById(videoId);
    if(video == null) {
        throw new GgktException(20001,"小节信息不存在");
    }

    Map<String, Object> map = new HashMap<>();
    map.put("videoSourceId", video.getVideoSourceId());
    map.put("appId", appId);
    return map;
}
```

#### 1.2、整合点播视频播放前端

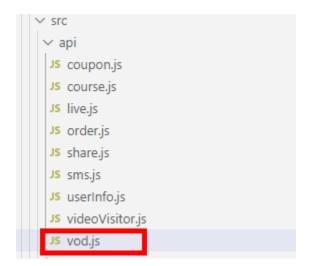

文档中心 入门中心 API中心 SDK中心 我的文档中心

```
■ 云点播
                 \Rightarrow
 11%, KL
 基本概念
 SDK 下载
  SDK 下载
  功能说明
 超级播放器教程
   阶段1: 用超级播放器播
   放视频
   阶段2: 开启防盗链后的
   视频播放
   阶段3: 自定义播放内容
   与样式
   阶段4:播放加密视频
   阶段5:播放长视频方案
```

```
<!-- 引入播放器 js 文件 -->
      <script src="//imgcache.qq.com/open/qcloud/video/tcplayer/tcplayer.v4.min</pre>
      <!-- 示例 CSS 样式可自行删除 -->
   </head>
      <video id="player-container-id" preload="auto" width="600" height="400" p</pre>
      <!--
      注意事项:
      * 播放器容器必须为 video 标签
      * player-container-id 为播放器容器的ID, 可自行设置
      * 播放器区域的尺寸请按需设置,建议通过 css 进行设置,通过css可实现容器自适应等效果
      * playsinline webkit-playsinline x5-playsinline 这几个属性是为了在标准移动端浏
      <script>
          var_player = TCPlayer("player-container-id", { /**player-container-id"
            fileID: " , /**请传入需要播放的视频fileID 必须 */
             appID: ", 7**请传入点播账号的appID 必须 */
            psign: ""
             /**其他参数请在开发文档中查看 */
      </script>
   </body>
</html>
```

# (1) 创建 js 定义接口

```
import request from "@/utils/request";
const api_name = "/api/vod";
export default {
    // 获取播放凭证
    getPlayAuth(courseId, videoId) {
        return request({
            url: `${api_name}/getPlayAuth/${courseId}/${videoId}`,
            method: "get",
        });
    },
};
```

## (2) courseInfo.vue 修改 play 方法

```
play(video) {
  let videoId = video.id;
  let isFree = video.isFree;
  this.$router.push({ path: '/play/'+this.courseId+'/'+videoId })
},
```

#### (3) index.html 引入文件

```
vue-mobile
→ __MACOSX
→ node_modules
→ public
★ favicon.ico
⇔ index.html
```

```
k
    href="//cloudcache.tencent-cloud.com/open/qcloud/video/tcplayer/tcplayer.css"
    rel="stylesheet"
/>
    <!-- 如需在IE8、9浏览器中初始化播放器,浏览器需支持Flash并在页面中引入 -->
    <!--[if lt IE 9]>
        <script src="//cloudcache.tencent-cloud.com/open/qcloud/video/tcplayer/ie8/videojs-ie8.js"></script src="//cloudcache.tencent-cloud.com/open/qcloud/video/tcplayer/ie8/videojs-ie8.js"></script >-- 如果需要在 Chrome 和 Firefox 等现代浏览器中通过 H5 播放 HLS 格式的视频, 需要在 tcplayer.v4.1.min.
        <script src="//imgcache.qq.com/open/qcloud/video/tcplayer/libs/hls.min.0.13.2m.js"></script>
        <!-- 引入播放器 js 文件 -->
        <script src="//imgcache.qq.com/open/qcloud/video/tcplayer/tcplayer.v4.1.min.js"></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></scri
```

# (4) 创建 play.vue 页面

```
id="player-container-id"
 preload="auto"
 width="600"
 height="400"
 playsinline
 webkit-playsinline
 x5-playsinline
<h1 class="van-ellipsis course_title">{{ courseVo.title }}</h1>
<div class="course_teacher_price_box">
   <div class="course_price">价格: </div>

# 3、付费观看点播课程接口

# 3.1、需求介绍

(1) 点击课程详情页立即购买

# 30天搞定Java核心技术

购买数课时数浏览数5999210067

# java基础课程

价格: ¥19800.00

主讲: 张老师

### 课程详情

# 课程大纲

(2) 点击确认下单, 生成课程订单

# 2022

价格: ¥10.00

主讲: 张老师

合计: ¥10.00 确认下单

# 3.2、编写创建订单接口

(1) 创建 OrderInfoApiController

```
@RestController
@RequestMapping("api/order/orderInfo")
public class OrderInfoApiController {

@Autowired
    private OrderInfoService orderInfoService;

@ApiOperation("新增点播课程订单")
    @PostMapping("submitOrder")
    public Result submitOrder(@RequestBody OrderFormVo orderFormVo, HttpServletRequest request) {
        //返回订单id
        Long orderId = orderInfoService.submitOrder(orderFormVo);
        return Result.ok(orderId);
    }
}
```

#### (2) 编写 Service

#### **OrderInfoService**

```
//生成点播课程订单
Long submitOrder(OrderFormVo orderFormVo);
```

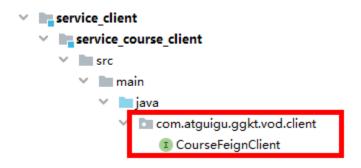

#### 3.3、创建获取课程信息接口

操作 service\_vod 模块

(1) CourseApiController 添加方法

```
@ApiOperation("根据ID查询课程")
@GetMapping("inner/getById/{courseId}")
public Course getById(
         @ApiParam(value = "课程ID", required = true)
         @PathVariable Long courseId){
    return courseService.getById(courseId);
}
```

(2) service\_course\_client 定义方法

```
@ApiOperation("根据ID查询课程")
@GetMapping("/api/vod/course/inner/getById/{courseId}")
Course getById(@PathVariable Long courseId);
```

# 3.4、创建获取优惠券接口

操作 service\_activity 模块

(1) 创建 CouponInfoApiController

```
@Api(tags = "优惠券接口")
@RestController
@RequestMapping("/api/activity/couponInfo")
public class CouponInfoApiController {
 @Autowired
  private CouponInfoService;
 @ApiOperation(value = "获取优惠券")
 @GetMapping(value = "inner/getById/{couponId}")
 public CouponInfo getById(@PathVariable("couponId") Long couponId) {
    return couponInfoService.getById(couponId);
   @ApiOperation(value = "更新优惠券使用状态")
 @GetMapping(value = "inner/updateCouponInfoUseStatus/{couponUseId}/{orderId}")
 public Boolean updateCouponInfoUseStatus(@PathVariable("couponUseId") Long couponUseId, @PathVariable("couponUseId")
   couponInfoService.updateCouponInfoUseStatus(couponUseId, orderId);
    return true
```

#### (2) 编写 CouponInfoService

```
@Override
public void updateCouponInfoUseStatus(Long couponUseId, Long orderId) {
    CouponUse couponUse = new CouponUse();
    couponUse.setId(couponUseId);
    couponUse.setOrderId(orderId);
    couponUse.setCouponStatus("1");
    couponUse.setUsingTime(new Date());
    couponUseService.updateById(couponUse);
}
```

# (3) 创建 service-activity-client 模块定义接口

```
@FeignClient(value = "service-activity")
public interface CouponInfoFeignClient {

    @ApiOperation(value = "获取优惠券")
    @GetMapping(value = "/api/activity/couponInfo/inner/getById/{couponId}")
    CouponInfo getById(@PathVariable("couponId") Long couponId);

    /**

    * 更新优惠券使用状态
    */
    @GetMapping(value = "/api/activity/couponInfo/inner/updateCouponInfoUseStatus/{couponUseId}/{@Boolean updateCouponInfoUseStatus(@PathVariable("couponUseId") Long couponUseId, @PathVariable("couponUseId") Long couponUseId, @PathVariable("couponUseId") Long couponUseId, @PathVariable("couponUseId") Long couponUseId, @PathVariable("couponUseId")
```

#### 3.5、获取当前用户 id

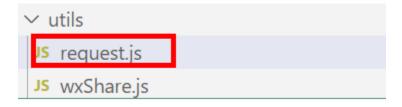

(1) common 模块引入依赖

(2) 复制工具类到 common 下的 service\_utils 模块

UserLoginInterceptor

# (3) 前端实现方式

```
// http request 拦截器
service.interceptors.request.use(
  (config) => {
    //获取localStorage里面的token值
    let token = window.localStorage.getItem("token") || "";
    if (token != "") {
        //把token值放到header里面
        config.headers["token"] = token;
    }
    return config;
},
   (err) => {
    return Promise.reject(err);
}
);
```

#### 3.6、生成**订单** Service

(1) service\_order 引入依赖

(2) OrderInfoServiceImpl

```
@Autowired
private CourseFeignClient courseFeignClient;
@Autowired
private UserInfoFeignClient userInfoFeignClient;
@Autowired
private CouponInfoFeignClient couponInfoFeignClient;
public Long submitOrder(OrderFormVo orderFormVo) {
    Long userId = AuthContextHolder.getUserId();
    Long courseId = orderFormVo.getCourseId();
    Long couponId = orderFormVo.getCouponId();
    LambdaQueryWrapper<OrderDetail> queryWrapper = new LambdaQueryWrapper<>();
   queryWrapper.eq(OrderDetail::getCourseId, courseId);
    queryWrapper.eq(OrderDetail::getUserId, userId);
    OrderDetail orderDetailExist = orderDetailService.getOne(queryWrapper);
    if(orderDetailExist != null){
        return orderDetailExist.getId(); //如果订单已存在,则直接返回订单id
    Course course = courseFeignClient.getById(courseId);
   if (course == null) {
        throw new GlktException(ResultCodeEnum.DATA_ERROR.getCode(),
               ResultCodeEnum.DATA_ERROR.getMessage());
    UserInfo userInfo = userInfoFeignClient.getById(userId);
    if (userInfo == null) {
       throw new GlktException(ResultCodeEnum DATA ERROR getCode(),
                ResultCodeEnum.DATA ERROR.getMessage());
```

```
BigDecimal couponReduce = new BigDecimal(0);
if(null != couponId) {
    CouponInfo couponInfo = couponInfoFeignClient.getById(couponId);
   couponReduce = couponInfo.getAmount();
OrderInfo orderInfo = new OrderInfo();
orderInfo.setUserId(userId);
orderInfo.setNickName(userInfo.getNickName());
orderInfo.setPhone(userInfo.getPhone());
orderInfo.setProvince(userInfo.getProvince());
orderInfo.setOriginAmount(course.getPrice());
orderInfo.setCouponReduce(couponReduce);
orderInfo.setFinalAmount(orderInfo.getOriginAmount().subtract(orderInfo.getCouponReduce()));
orderInfo.setOutTradeNo(OrderNoUtils.getOrderNo());
orderInfo.setTradeBody(course.getTitle());
orderInfo.setOrderStatus("0");
this.save(orderInfo);
OrderDetail orderDetail = new OrderDetail();
orderDetail.setOrderId(orderInfo.getId());
orderDetail.setUserId(userId);
orderDetail.setCourseId(courseId);
orderDetail.setCourseName(course.getTitle());
orderDetail.setCover(course.getCover());
orderDetail.setOriginAmount(course.getPrice());
orderDetail.setCouponReduce(new BigDecimal(0));
orderDetail.setFinalAmount(orderDetail.getOriginAmount().subtract(orderDetail.getCouponReduce
orderDetailService.save(orderDetail);
if(null != orderFormVo.getCouponUseId()) {
   couponInfoFeignClient.updateCouponInfoUseStatus(orderFormVo.getCouponUseId(), orderInfo.g
```

```
return orderInfo.getId();
}
```

# 4、微信支付

#### 4.1、微信支付

接口文档:https://pay.weixin.qq.com/wiki/doc/api/jsapi.php?chapter=7\_1

#### 4.2、公众号配置

#### (1) 绑定域名

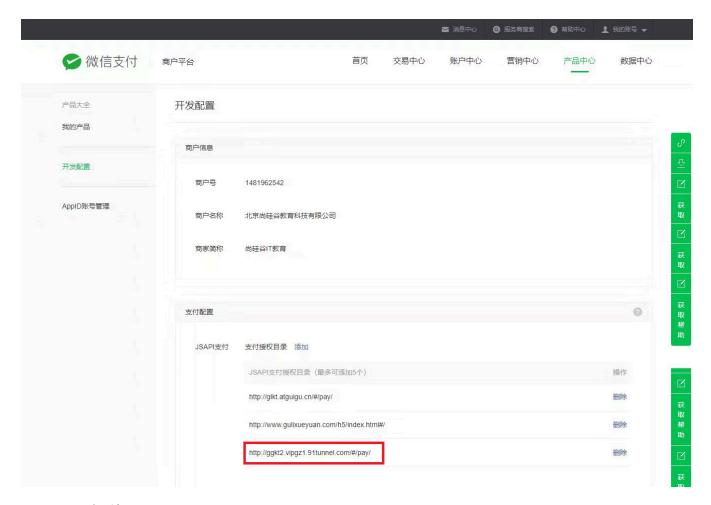

与微信分享一致

先登录微信公众平台进入"设置与开发","公众号设置"的"功能设置"里填写"JS 接口安全域名"。

说明:因为**测试号不支持支付功能**,需要使用正式号才能进行测试。

# (2) 商户平台配置支付目录

# 4.3、创建订单支付接口

(1) 创建 WXPayController

## (2) 创建 WXPayService

```
public interface WXPayService {
   Map createJsapi(String orderNo);
}
```

# (3) service\_order 引入依赖

```
<dependency>
  <groupId>com.github.wxpay</groupId>
  <artifactId>wxpay-sdk</artifactId>
  <version>0.0.3</version>
</dependency>
```

# (4) 创建 WXPayServiceImpl

```
@Slf4j
public class WXPayServiceImpl implements WXPayService {
 @Autowired
 private OrderInfoService orderInfoService;
  private UserInfoFeignClient userInfoFeignClient;
 @Override
  public Map<String, String> createJsapi(String orderNo) {
    try
     Map<String, String> paramMap = new HashMap();
      paramMap.put("appid", "wxf913bfa3a2c7eeeb");
      paramMap.put("mch_id", "1481962542");
     paramMap.put("nonce_str", WXPayUtil.generateNonceStr());
     paramMap.put("body", "test");
      paramMap.put("out_trade_no", orderNo);
     paramMap.put("total_fee", "1");
      paramMap.put("spbill_create_ip", "127.0.0.1");
      paramMap.put("notify_url", "http://glkt.atguigu.cn/api/order/wxPay/notify");
     paramMap.put("trade_type", "JSAPI");
      paramMap.put("openid", "oQTXC56lAy3xMOCkKCImHtHoLL");
      HttpClientUtils client = new HttpClientUtils("https://api.mch.weixin.qq.com/pay/unifiedorder
      client.setXmlParam(WXPayUtil.generateSignedXml(paramMap, "MXb72b9RfshXZD4FRGV5KLqmv5bx9LT9"
     client.setHttps(true);
      client.post();
```

```
String xml = client.getContent();
 Map<String, String> resultMap = WXPayUtil.xmlToMap(xml);
 if(null != resultMap.get("result_code") && !"SUCCESS".equals(resultMap.get("result_code"))
   System.out.println("error1");
 Map<String, String> parameterMap = new HashMap<>();
 String prepayId = String.valueOf(resultMap.get("prepay_id"));
  String packages = "prepay_id=" + prepayId;
 parameterMap.put("appId", "wxf913bfa3a2c7eeeb");
  parameterMap.put("nonceStr", resultMap.get("nonce str"));
  parameterMap.put("package", packages);
  parameterMap.put("signType", "MD5");
 parameterMap.put("timeStamp", String.valueOf(new Date().getTime()));
  String sign = WXPayUtil.generateSignature(parameterMap, "MXb72b9RfshXZD4FRGV5KLqmv5bx9LT9")
 Map<String, String> result = new HashMap();
 result.put("appId", "wxf913bfa3a2c7eeeb");
 result.put("timeStamp", parameterMap.get("timeStamp"));
 result.put("nonceStr", parameterMap.get("nonceStr"));
 result.put("signType", "MD5");
 result.put("paySign", sign);
 result.put("package", packages);
 System.out.println(result);
 return result;
} catch (Exception e) {
 e.printStackTrace();
  return new HashMap<>();
```

#### 4.4、服务号测试过程

(1) 修改 service-user 模块配置文件

```
# 硅谷课堂微信公众平台 appId
wechat.appId-wxf913bfa3a2c7eeeb
# 硅谷课堂微信公众平台api秘钥
wechat.appSecret-cd360d429e5c8db0c638d5ef9df74f6d
```

# (2) service-user 模块创建 controller

```
@Controller
@RequestMapping("/api/user/openid")
public class GetOpenIdController {
   @Autowired
   private WxMpService;
   @GetMapping("/authorize")
   public String authorize(@RequestParam("returnUrl") String returnUrl, HttpServletRequest request
       String userInfoUrl =
               "http://ggkt.vipgz1.91tunnel.com/api/user/openid/userInfo";
       String redirectURL = wxMpService
                .oauth2buildAuthorizationUrl(userInfoUrl,
                                            WxConsts OAUTH2 SCOPE USER INFO,
                                            URLEncoder.encode(returnUrl.replace("guiguketan", "#
       return "redirect:" + redirectURL;
   @GetMapping("/userInfo")
   @ResponseBody
   public String userInfo(@RequestParam("code") String code,
                          @RequestParam("state") String returnUrl) throws Exception {
       WxMpOAuth2AccessToken wxMpOAuth2AccessToken = this.wxMpService.oauth2getAccessToken(code)
       String openId = wxMpOAuth2AccessToken.getOpenId();
       System.out.println("【微信网页授权】openId={}"+openId);
       return openId;
```

## (3) 修改前端 App.vue

```
if (token == "") {
    let url = window.location.href.replace("#", "guiguketan");
    //修改认证controller路径
    window.location =
        "http://ggkt.vipgz1.91tunnel.com/api/user/openid/authorize?returnUrl=" +
        url;
}
```

(4) 复制返回的 openid 到支付接口中测试

# oQTXC56lAy3xMOCkKClmHtHoLL

- 4.5、整合点播视频支付前端
  - (1) trade.vue

```
<van-image width="100%" height="200" :src="courseVo.cover" />
<h1 class="van-ellipsis course title">{{ courseVo.title }}</h1></h1>
 <div class="course_teacher_price">
   <div class="course_price">价格: </div>
   <div class="course_price_number"> \frac{4}{{ courseVo.price }} </div>
  </div>
</div>
<div class="course_teacher_price_box">
  <div class="course_teacher_box">
   <div class="course_teacher">主讲: {{ teacher.name }}</div>
   <van-image :src="teacher.avatar" round width="50px" height="50px" />
  </div>
<van-loading vertical="true" v-show="loading">加载中...</van-loading>
  style="position:fixed;left:0px;bottom:50px;width:100%;height:50px;z-index:999;"
   :coupons="coupons"
   :chosen-coupon="chosenCoupon"
   @click="showList = true"
  <van-popup
   v-model="showList"
   round
   position="bottom"
   style="height: 90%; padding-top: 4px;"
```

```

      this.onBridgeReady(response.data);
```

```
onBridgeReady(data) {
 let that = this;
 console.log(data);
 WeixinJSBridge.invoke(
    "getBrandWCPayRequest",
     appId: data.appId, //公众号ID, 由商户传入
     timeStamp: data.timeStamp, //时间戳, 自1970年以来的秒数
     nonceStr: data.nonceStr, //随机串
     package: data.package,
     signType: data.signType, //微信签名方式:
     paySign: data.paySign, //微信签名
    function (res) {
     if (res.err_msg == "get_brand_wcpay_request:ok") {
       console log("支付成功");
       that.queryPayStatus();
queryPayStatus() {
 orderApi.queryPayStatus(this.orderInfo.outTradeNo).then((response) => {
   console.log(response.data);
   this fetchData();
see() {
 this.$router.push({ path: "/courseInfo/" + this.orderInfo.courseId });
```

```
<style lang="scss" scoped>
 .gap {
   height: 10px;
 ::v-deep.van-image {
   display: block;
   background-color: #82848a;
   color: white;
   padding: 5px;
   text-align: center;
   border-right: 1px solid #939393;
     font-size: 14px;
     margin: 0;
     margin: 0;
     font-size: 16px;
   font-size: 20px;
   margin: 10px;
  .course_teacher_price_box {
```

```
margin: 10px;
 display: flex;
 justify-content: space-between;
 align-items: center;
 .course_teacher_price {
   display: flex;
   font-size: 14px;
   align-items: center;
   .course_price_number {
     color: red;
     font-size: 18px;
     font-weight: bold;
   display: flex;
   justify-content: center;
   align-items: center;
    margin-right: 20px;
.course_contents {
 margin: 10px;
   color: #68cb9b;
   font-weight: bold;
```

```
margin-bottom: 20px;
}

course_chapter_list {
    display: flex;
    justify-content: space-between;
    align-items: center;

h2 {
    font-size: 14px;
    }

p {
    margin: 0;
    }
}
</style>
```

# 4.6、订单详情接口

(1) OrderInfoApiController 添加方法

```
@ApiOperation(value = "获取")
@GetMapping("getInfo/{id}")
public Result getInfo(@PathVariable Long id) {
    OrderInfoVo orderInfoVo = orderInfoService.getOrderInfoVoById(id);
    return Result.ok(orderInfoVo);
}
```

(2) OrderInfoServiceImpl 实现方法

```
@Override
public OrderInfoVo getOrderInfoVoById(Long id) {
    OrderInfo orderInfo = this.getById(id);
    OrderDetail orderDetail = orderDetailService.getById(id);

    OrderInfoVo orderInfoVo = new OrderInfoVo();
    BeanUtils.copyProperties(orderInfo, orderInfoVo);
    orderInfoVo.setCourseId(orderDetail.getCourseId());
    orderInfoVo.setCourseName(orderDetail.getCourseName());
    return orderInfoVo;
}
```

#### 4.7、查询支付结果

(1) WXPayController 添加方法

## (2) WXPayServiceImpl 实现方法

```
public Map queryPayStatus(String orderNo) {
   Map paramMap = new HashMap<>();
    paramMap.put("appid", wxPayAccountConfig.getAppId());
    paramMap.put("mch_id", wxPayAccountConfig.getMchId());
    paramMap.put("out_trade_no", orderNo);
    paramMap.put("nonce_str", WXPayUtil.generateNonceStr());
   HttpClientUtils client = new HttpClientUtils("https://api.mch.weixin.qq.com/pay/orderquery");
    client.setXmlParam(WXPayUtil.generateSignedXml(paramMap, wxPayAccountConfig.getKey()));
   client.setHttps(true);
   client.post();
   String xml = client.getContent();
   Map<String, String> resultMap = WXPayUtil.xmlToMap(xml);
   return resultMap;
 } catch (Exception e) {
   e.printStackTrace();
  return null;
```

## (3) OrderInfoServiceImpl 实现方法

```
@Override
public void updateOrderStatus(String out_trade_no) {
    //根据out_trade_no查询订单
    LambdaQueryWrapper<OrderInfo> wrapper = new LambdaQueryWrapper<>>();
    wrapper.eq(OrderInfo::getOutTradeNo,out_trade_no);
    OrderInfo orderInfo = baseMapper.selectOne(wrapper);
    //更新订单状态 1 已经支付
    orderInfo.setOrderStatus("1");
    baseMapper.updateById(orderInfo);
}
```

# 二、直播介绍

# 1、项目需求

硅谷课堂会定期推出直播课程,方便学员与名师之间的交流互动,在直播间老师可以推荐点播课程(类似直播带货),学员可以点赞交流,购买推荐的点播课程。

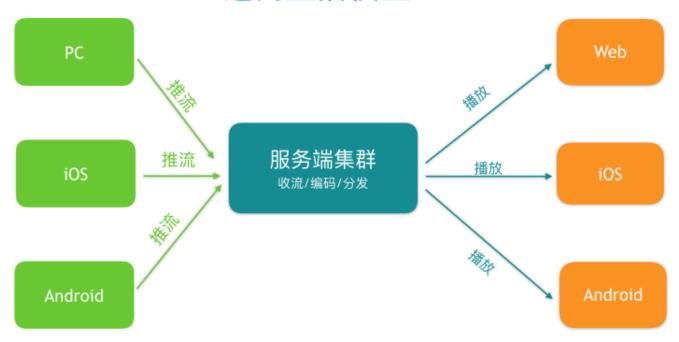

# 2、了解直播

一个完整直播实现流程:

1.采集、2.滤镜处理、3.编码、4.推流、5.CDN分发、6.拉流、7.解码、8.播放、9.聊天互动。

#### 2.1、通用直播模型

# 通用直播模型

- 1. 首先是主播方,它是产生视频流的源头,由一系列流程组成:第一,通过一定的设备来采集数据;第二,将采集的这些视频进行一系列的处理,比如水印、美颜和特效滤镜等处理;第三,将处理后的结果视频编码压缩成可观看可传输的视频流;第四,分发推流,即将压缩后的视频流通过网络通道传输出去。
- 2. 其次是播放端,播放端功能有两个层面,第一个层面是关键性的需求;另一层面是业务层面的。先看第一个层面,它涉及到一些非常关键的指标,比如秒开,在很多场景当中都有这样的要求,然后是对于一些重要内容的版权保护。为了达到更好的

效果,我们还需要配合服务端做智能解析,这在某些场景下也是关键性需求。再来看第二个层面也即业务层面的功能,对于一个社交直播产品来说,在播放端,观众希望能够实时的看到主播端推过来的视频流,并且和主播以及其他观众产生一定的互动,因此它可能包含一些像点赞、聊天和弹幕这样的功能,以及礼物这样更高级的道具。

- 3. 我们知道,内容产生方和消费方一般都不是一一对应的。对于一个直播产品来讲,最直观的体现就是一个主播可能会有很多粉丝。因此,我们不能直接让主播端和所有播放端进行点对点通信,这在技术上是做不到或者很有难度。主播方播出的视频到达播放端之前,需要经过一系列的中间环节,也就是我们这里讲的直播服务器端。
- 4. 直播服务器端提供的最核心功能是收集主播端的视频推流,并将其放大后推送给所有观众端。除了这个核心功能,还有很多运营级别的诉求,比如鉴权认证,视频连线和实时转码,自动鉴黄,多屏合一,以及云端录制存储等功能。另外,对于一个主播端推出的视频流,中间需要经过一些环节才能到达播放端,因此对中间环节的质量进行监控,以及根据这些监控来进行智能调度,也是非常重要的诉求。
- 5. 实际上无论是主播端还是播放端,他们的诉求都不会仅仅是拍摄视频和播放视频这 么简单。在这个核心诉求被满足之后,还有很多关键诉求需要被满足。比如,对于 一个消费级的直播产品来说,除了这三大模块之外,还需要实现一个业务服务端来 进行推流和播放控制,以及所有用户状态的维持。如此,就构成了一个消费级可用 的直播产品。

#### 2.2、如何快速开发完整直播

#### 2.2.1、利用第三方 SDK 开发

- 七牛云:七牛直播云是专为直播平台打造的全球化直播流服务和一站式实现 SDK 端 到端直播场景的企业级直播云服务平台。
  - ☞ 熊猫 TV. 龙珠 TV 等直播平台都是用的七牛云。
- 网易视频云:基于专业的跨平台视频编解码技术和大规模视频内容分发网络,提供 稳定流畅、低延时、高并发的实时音视频服务,可将视频直播无缝对接到自身 App。
- 阿里云视频直播解决方案
  - ☞ 直播推流 SDK(iOS/Android)
  - ☞ 直播播放器 SDK(iOS/Android)
- 欢拓云直播平台:欢拓是一家以直播技术为核心的网络平台,旨在帮助人们通过网络也能实现真实互动通讯。

#### 2.2.2、第三方 SDK 好处

- 降低成本:
  - ☞ 使用好的第三方企业服务,将不用再花费大量的人力物力去研发。
- 提升效率:
  - ☞ 第三方服务的专注与代码集成所带来的方便,所花费的时间可能仅仅是 1-2 个小时,节约近 99% 的时间,足够换取更多的时间去和竞争对手斗智斗勇,增加更大的成功可能性。
- 降低风险:
  - ☞ 借助专业的第三方服务,由于它的快速、专业、稳定等特点,能够极大地加强产品的竞争能力(优质服务、研发速度等),缩短试错时间,必将是创业中保命的手段之一。
- 专业的事, 找专业的人来做。
  - ☞ 第三方服务最少是 10-20 人的团队专注地解决同一个问题,做同一件事情。

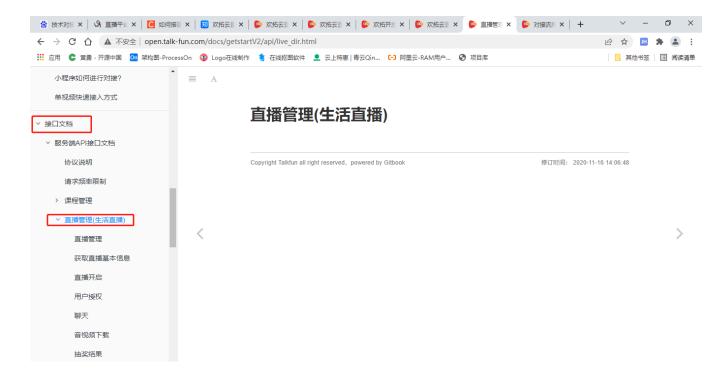

# 3、欢拓云直播

根据上面的综合对比和调研,我们最终选择了"欢拓与直播平台",它为我们提供了完整的可以直接使用的示例代码,方便我们开发对接。

欢拓是一家以直播技术为核心的网络平台,旨在帮助人们通过网络也能实现真实互动通讯。从 2010 年开始,欢拓就专注于音频、视频的采样、编码、后处理及智能传输研究,并于 2013 年底 正式推出了针对企业/开发者的直播云服务系统,帮助开发者轻松实现真人互动。该系统适用场景包括在线教育、游戏语音、娱乐互动、远程会议(PC、移动均可)等等。针对应用场景,采用先进技术解决方案和产品形态,让客户和客户的用户满意!

官网:https://www.talk-fun.com/

接口文档地址:http://open.talk-fun.com/docs/getstartV2/document.html

# 三、直播对接

# 1、直播体验

## 1.1、开通账号

通过官网:https://www.talk-fun.com/, 联系客户或 400 电话开通账号,开通 "生活直播" 权限。开通后注意使用有效期,一般一周左右,可以再次申请延期。

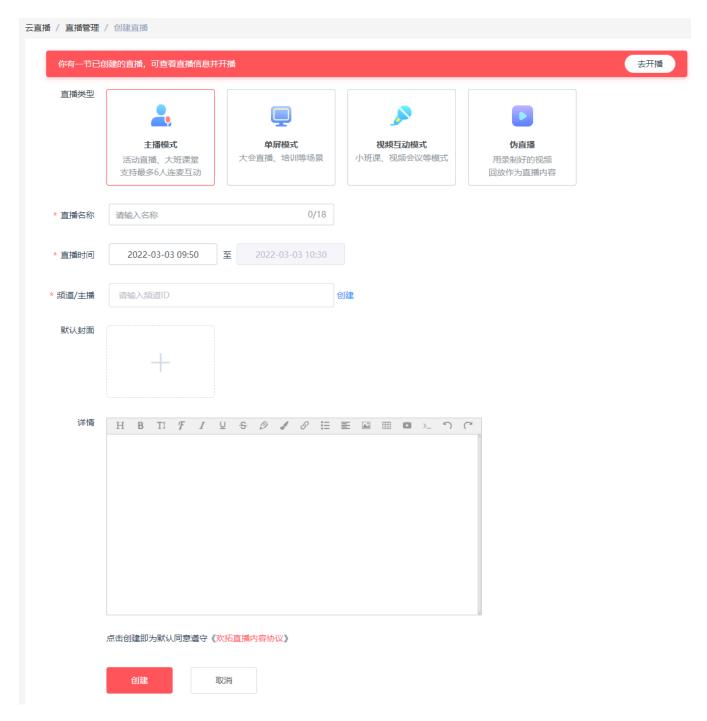

说明:官网免费试用,功能有限制,不建议使用

## 1.2、创建直播

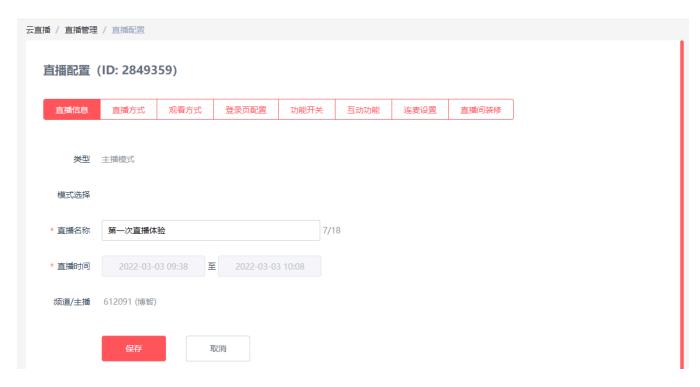

1、在直播管理创建直播

2、创建直播,选择主播模式

# 3、配置直播,可以自行查看

## 1.3、开始直播

1、在直播列表,点击"直播入口"

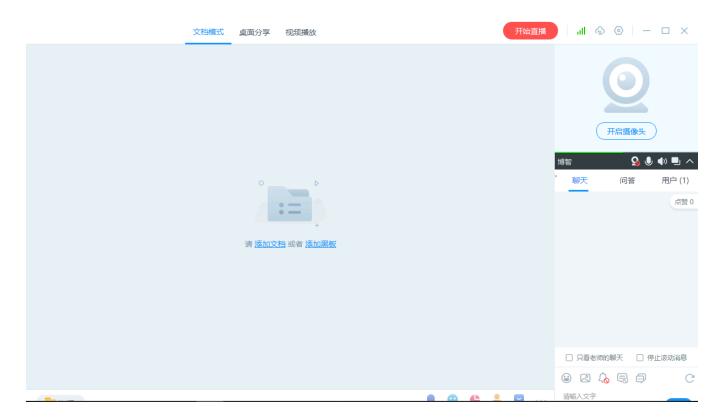

主播端下载"云直播客户端", "频道 id 与密码"为直播客户端的登录账号;

下面还有管理员,主播进行直播时,助教可以在聊天时与观众互动。

# 2、电脑端安装后如图

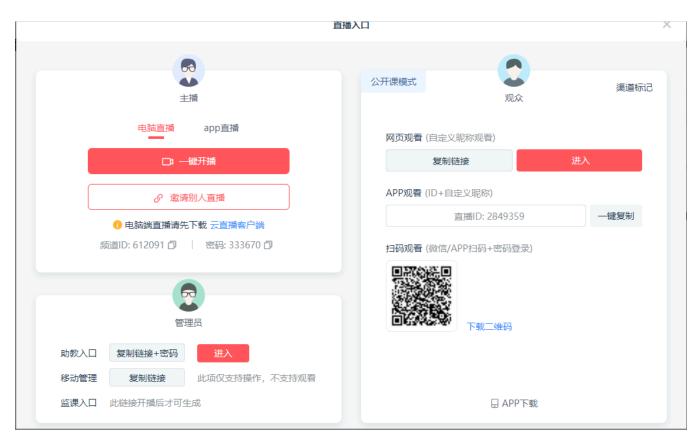

# 3、使用"频道 id 与密码"登录

4、点击"开始直播",打开摄像头即可开始直播。

#### 1.4、用户观看

1、在直播列表,点击"直播入口"

2、在观众一栏点击进入,即可在网页端观看直播

#### 1.5、体验总结

上面的体验完全能够满足我们业务的需要,硅谷课堂的需求是定期推出直播课程,方便学员与名师之间的交流互动,在直播间老师可以推荐点播课程(类似直播带货),学员可以点赞交流,购买推荐的点播课程。

直播平台只是做了直播相关的业务,不能与我们的业务进行衔接,我们期望是在硅谷课堂的管理 后台管理直播相关的业务,那么怎么做呢?对接直播业务接口,直播平台有对应的直播接口,我 们直接对接即可。
